Ester Boserup : The Conditions of Agricultural Growth: The Economics of Agrarian Change Under Population Pressure before purchasing it in order to gauge whether or not it would be worth my time, and all praised The Conditions of Agricultural Growth: The Economics of Agrarian Change Under Population Pressure:

0 of 0 people found the following review helpful. This is a classic of agricultural studies. Essential for ...By CustomerThis is a classic of agricultural studies. Essential for those who deal with crop intensity (frequency; more than one harvest in the year). Fernando L. Garagorry, Embrapa, Brazil.0 of 1 people found the following review helpful. The book to understand agricultureBy Leon LamThis is a classical study of global agricultural development. Boserup argues that increase in population is the necessary precondition for agricultural growth and any advancement in farming tools and techniques. Her analysis is sound and persuasive. This book is effective, succinct and very readable even for general audience. A must-read for all.6 of 6 people found the following review helpful. Modern classicBy jim thorntonEver since Malthus most people have believed that increasing population slows or even reverses economic development. However in 1965 a young Danish economist wrote this small book questioning this orthodoxy. She showed that over most of history the effect of increasing population has been positive. Most serious

demographers and economists now accept that she was right. It is tragic that the general public and population doomsayers have still not got the message, and persist in pushing family planning down the throats of the poor in the vain hope that it will help economic development. This book is a modern classic.

When it first appeared in 1965, *The Conditions of Agricultural Growth* heralded a breakthrough in the theory of agricultural development. Whereas 'development' had previously been seen as the transformation of traditional communities by the introduction (or imposition) of new technologies, Ester Boserup argued that changes and improvements occur from within agricultural communities, and that improvements are governed not only by outside interference, but by those communities themselves. Using extensive analyses of the costs and productivity of the main systems of traditional agriculture, Ester Boserup concludes that technical, economic and social changes are unlikely to take place unless the community concerned is exposed to the pressure of population growth. In sharp contrast to widely accepted ideas, she shows how population growth may be the main stimulus to agrarian change. In developing this theme, the author identifies successive stages of agriculture, characterized by differences in techniques of cultivation and in social structure and show how they can be explained by differences in population density. This book is of relevance not only to economists, but also to historians interested in the way present changes in agrarian communities parallel those of the past.

"a classic in the literature of development... a source of insight and inspiration for further research." Dr Robert Chambers, Institute of Development Studies
